1 Usage

1.1 Introduction

This core converts the APB3 bus to the uP bus. This allows any core with a uP bus to be interfaced with a APB3 bus. These busses are very similar and is done with combinatoral logic only.

1.2 Dependencies

The following are the dependencies of the cores.

- fusesoc 2.X
- iverilog (simulation)
- cocotb (simulation)

1.2.1 fusesoc_info Depenecies

- dep
 - AFRL:utility:helper:1.0.0

1.3 In a Project

This core is made to interface APB3 bus to uP based device cores. This is part of a family of converters based on Analog Devices uP specification. Using this allows usage of Analog Devices AXI Lite core, AFRL APB3, AFRL Wishbone Classic, and AFRL Wishbone Pipeline converters. Meaning any uP core can be easily customized to any bus quickly. These are made for relatively slow speed bus device interfaces. An example of a Verilog uP interface provided below.

```
//output signals assigned to registers.
assign up_rack  = r_up_rack;
assign up_wack  = r_up_wack;
assign up_rdata = r_up_rdata;
assign irq      = r_irq;

assign s_rx_ren = (up_raddr[3:0] == RX_FIFO_REG) &&
    ↪ up_rreq;

//up registers decoder
always @(posedge clk)
begin
    if(rstn == 1'b0)
```

```

begin
    r_up_rack    <= 1'b0;
    r_up_wack    <= 1'b0;
    r_up_rdata   <= 0;

    r_overflow   <= 1'b0;

    r_control_reg <= 0;
end else begin
    r_up_rack    <= 1'b0;
    r_up_wack    <= 1'b0;
    r_tx_wen     <= 1'b0;
    r_up_rdata   <= r_up_rdata;
    //clear reset bits
    r_control_reg[RESET_RX_BIT] <= 1'b0;
    r_control_reg[RESET_TX_BIT] <= 1'b0;

    if(rx_full == 1'b1)
    begin
        r_overflow <= 1'b1;
    end

    //read request
    r_up_rack <= up_rreq;

    if(up_rreq == 1'b1)
    begin
        case(up_raddr[3:0])
            RX_FIFO_REG: begin
                r_up_rdata <= rx_rdata & {{(BUS_WIDTH*8-
                    ↪ DATA_BITS){1'b0}}, {DATA_BITS{1'b1}}}};
            end
            STATUS_REG: begin
                r_up_rdata <= {{(BUS_WIDTH*8-8){1'b0}},
                    ↪ s_parity_err, s_frame_err, r_overflow,
                    ↪ r_irq_en, tx_full, tx_empty, rx_full,
                    ↪ rx_valid};
                r_overflow <= 1'b0;
            end
            default: begin
                r_up_rdata <= 0;
            end
        endcase
    end

    r_up_wack <= up_wreq;

```

```

//write request
if(up_wreq == 1'b1)
begin
case(up_waddr[3:0])
TX_FIFO_REG: begin
r_tx_wdata <= up_wdata;
r_tx_wen <= 1'b1;
end
CONTROL_REG: begin
r_control_reg <= up_wdata;
end
default: begin
end
endcase
end
end
end

//up control register processing and fifo reset
always @(posedge clk)
begin
if(rstn == 1'b0)
begin
r_rstn_rx_delay <= ~0;
r_rstn_tx_delay <= ~0;
r_irq_en <= 1'b0;
end else begin
r_rstn_rx_delay <= {1'b1, r_rstn_rx_delay[
↪ FIFO_DEPTH-1:1]};
r_rstn_tx_delay <= {1'b1, r_rstn_tx_delay[
↪ FIFO_DEPTH-1:1]};

if(r_control_reg[RESET_RX_BIT])
begin
r_rstn_rx_delay <= {FIFO_DEPTH{1'b0}};
end

if(r_control_reg[RESET_TX_BIT])
begin
r_rstn_tx_delay <= {FIFO_DEPTH{1'b0}};
end

if(r_control_reg[ENABLE_INTR_BIT] != r_irq_en)
begin
r_irq_en <= r_control_reg[ENABLE_INTR_BIT];
end
end
end

```

```
        end
    end
end
```

2 Architecture

The only module is the up_apb3 module. It is listed below.

- **up_apb3** Convert APB3 to the Analog Devices uP BUS. (see core for documentation).

Please see 5 for more information.

3 Building

The APB3 core is written in Verilog 2001. They should synthesize in any modern FPGA software. The core comes as a fusesoc packaged core and can be included in any other core. Be sure to make sure you have meet the dependencies listed in the previous section.

3.1 fusesoc

Fusesoc is a system for building FPGA software without relying on the internal project management of the tool. Avoiding vendor lock in to Vivado or Quartus. These cores, when included in a project, can be easily integrated and targets created based upon the end developer needs. The core by itself is not a part of a system and should be integrated into a fusesoc based system. Simulations are setup to use fusesoc and are a part of its targets.

3.2 Source Files

3.2.1 fusesoc_info File List

- src
 - src/up_apb3.v
- tb
 - tb/tb_apb3.v
- tb_cocotb
 - 'tb/tb_cocotb.py': 'file_type': 'user', 'copyto': '.'
 - 'tb/tb_cocotb.v': 'file_type': 'verilogSource'

3.3 Targets

3.3.1 fusesoc_info Targets

- default
Info: Default for IP intergration.
- sim
Info: Base simulation using icarus as default.
- sim_cocotb
Info: Cocotb unit tests

3.4 Directory Guide

Below highlights important folders from the root of the directory.

1. **docs** Contains all documentation related to this project.
 - **manual** Contains user manual and github page that are generated from the latex sources.
 - **specs** Contains specifications for the bus.
2. **src** Contains source files for the core
3. **tb** Contains test bench files for iverilog and cocotb
 - **cocotb** testbench files

4 Simulation

There are a few different simulations that can be run for this core.

4.1 iverilog

iverilog is used for simple test benches for quick verification, visually, of the core.

4.2 cocotb

To use the cocotb tests you must install the following python libraries.

```
$ pip install cocotb
$ pip install cocotbext-up
$ pip install cocotbext-apb
```

Each module has a cocotb based simulation. These use the cocotb extensions APB and uP. To install these locally use the following.cocotb

```
$ pip install —breaksystem-packages -e .
```

- **sim_cocotb** Standard simulation APB3 to uP conversion using cocotbexts.

Then you must use the cocotb sim target. The targets above can be run with various parameters.

```
$ fusesoc run —target sim_cocotb AFRL:bus:up_apb3
  ↪ :1.0.0
```

5 Module Documentation

- **up_apb3** APB3 to uP converter
- **tb_apb3-v** Verilog test bench
- **tb_cocotb-py** Cocotb python test routines
- **tb_cocotb-v** Cocotb verilog test bench

The next sections document the module in detail.

up_apb3

```
module up_apb3 #(
    parameter
    ADDRESS_WIDTH
    =
    16,
    parameter
    BUS_WIDTH
    =
    4
) ( input clk, input rstn, input [ADDRESS_WIDTH-1:0] s_apb_paddr, input [0:0] s_apb_wdata,
```

APB3 slave to uP interface

Parameters

<code>ADDRESS_WIDTH</code> <small>parameter</small>	Width of the APB3 address port in bits.
<code>BUS_WIDTH</code> <small>parameter</small>	Width of the APB3 bus data port in bytes.

Ports

<code>clk</code>	Clock
<code>rstn</code>	negative reset
<code>s_apb_paddr</code>	APB3 address bus, up to 32 bits wide.
<code>s_apb_psel</code>	APB3 select per slave (1 for this core).
<code>s_apb_penable</code>	APB3 enable device for multiple transfers after first.
<code>s_apb_pready</code>	APB3 ready is a output from the slave to indicate its able to process the request.
<code>s_apb_pwrite</code>	APB3 Direction signal, active high is a write access. Active low is a read access.
<code>s_apb_pwdata</code>	APB3 write data port.
<code>s_apb_prdata</code>	APB3 read data port.
<code>s_apb_pslverror</code>	APB3 error indicates transfer failure, not implimented.
<code>up_rreq</code>	uP bus read request
<code>up_rack</code>	uP bus read ack
<code>up_raddr</code>	uP bus read address
<code>up_rdata</code>	uP bus read data
<code>up_wreq</code>	uP bus write request
<code>up_wack</code>	uP bus write ack
<code>up_waddr</code>	uP bus write address
<code>up_wdata</code>	uP bus write data

VARIABLES

valid

```
assign valid = s_apb_psel & s_apb_penable & rstn
```

This will add an extra clock cycle. since enable happens after select. both are needed to use the device.

s_apb_pslverror

```
assign s_apb_pslverror = 1'b0
```

APB3 error is always 0, no error.

up_waddr

```
assign up_waddr = s_apb_paddr[ADDRESS_WIDTH-1:shift]
```

up_waddr and s_apb_addr are a direct mapping.

up_waddr

up_raddr and s_apb_addr are a direct mapping.

up_wdata

```
assign up_wdata = s_apb_pdata
```

up_wdata and s_apb_pdata are a direct mapping.

s_apb_prdata

```
assign s_apb_prdata = up_rdata
```

s_apb_prdata and up_rdata are a direct mapping.

up_wreq

```
assign up_wreq = valid & s_apb_pwrite & r_cycle
```

uP write request is a combination of the APB3 valid and APB3 write select (active high is write).

up_rreq

```
assign up_rreq = valid & ~s_apb_pwrite & r_cycle
```

uP read request is a combination of the APB3 valid and APB3 write select (active low is read).

s_apb_pready

```
assign s_apb_pready = (  
  up_wack |  
  up_rack  
) & rstn
```

Ready is being treated like a awk

FUNCTIONS

random_bool

```
def random_bool()
```

Return a infinite cycle of random bools

Returns: List

start_clock

```
def start_clock(  
    dut  
)
```

Start the simulation clock generator.

Parameters

dut Device under test passed from cocotb test function

reset_dut

```
async def reset_dut(  
    dut  
)
```

Cocotb coroutine for resets, used with await to make sure system is reset.

increment test

Coroutine that is identified as a test routine. Write data, on one clock edge, read on the next.

Parameters

dut Device under test passed from cocotb.

increment test stream

Coroutine that is identified as a test routine. Write data, in a stream to registers, then read back stream.

Parameters

dut Device under test passed from cocotb.

in_reset

```
@cocotb.test()  
async def in_reset(  
    dut  
)
```

Coroutine that is identified as a test routine. This routine tests if device stays in unready state when in reset.

Parameters

dut Device under test passed from cocotb.

no_clock

```
@cocotb.test()  
async def no_clock(  
    dut  
)
```

Coroutine that is identified as a test routine. This routine tests if no ready when clock is lost and device is left in reset.

Parameters

dut Device under test passed from cocotb.

```
module tb_cocotb #(
  parameter
    ADDRESS_WIDTH
    =
    16,
  parameter
    BUS_WIDTH
    =
    4
) ( input clk, input rstn, input [ADDRESS_WIDTH-1:0] s_apb_paddr, input [0:0] s_apb_wdata,
```

APB3 slave to uP interface DUT

Parameters

ADDRESS_WIDTH parameter	Width of the APB3 address port in bits.
BUS_WIDTH parameter	Width of the APB3 bus data port in bytes.

Ports

clk	Clock
rstn	negative reset
s_apb_paddr	APB3 address bus, up to 32 bits wide.
s_apb_psel	APB3 select per slave (1 for this core).
s_apb_penable	APB3 enable device for multiple transfers after first.
s_apb_pready	APB3 ready is a output from the slave to indicate its able to process the request.
s_apb_pwrite	APB3 Direction signal, active high is a write access. Active low is a read access.
s_apb_pwdata	APB3 write data port.
s_apb_prdata	APB3 read data port.
s_apb_pslverror	APB3 error indicates transfer failure, not implimented.
up_rreq	uP bus read request
up_rack	uP bus read ack
up_raddr	uP bus read address
up_rdata	uP bus read data
up_wreq	uP bus write request
up_wack	uP bus write ack
up_waddr	uP bus write address
up_wdata	uP bus write data
